STUDENT STACK DEPLOYMENT PLAYBOOK

THE FREE STACK SPRINT

$2,000 in 45 days on the WGU student stack: GitHub Copilot Pro, free cloud credits, a free domain, and Baltimore's connectivity lifelines — wired into one zero-overhead revenue machine for Mike Builds.

MICHAEL MAZIQUE

MIKE BUILDS · WGU B.S. AI ENGINEERING

OCTOBER 1 — NOVEMBER 15, 2026 · BALTIMORE, MD

Table of Contents

1. The Mission — $2,000 in 45 Days 2

2. Phase 0 — Claim the Stack (Days 1-3) 3

3. Phase 1 — Infrastructure on $0 (Days 2-5) 4

The renewal trap, and how to defuse it 4

Publish-anywhere deployment — the baked site 5

The last two pieces of infrastructure 5

4. Phase 2 — Baltimore Lifeline & Connectivity 6

5. Phase 3 — The $2,000 Machine (Days 5-45) 7

The daily 15-touch ritual 7

The demo flow — proof before the ask 7

Closing and collecting — the honest money picture 8

6. Phase 4 — Local Hardware + Free AI 9

7. Phase 5 — WGU Without the Time Sink 10

8. The Calendar — Week by Week 10

9. The Verified Benefits Ledger 12

10. Guardrails — Anti-Stall Doctrine 14

The next 24 hours 14

1. The Mission — $2,000 in 45 Days

The operator: 33 years old, starting the B.S. in AI Engineering at Western Governors University on October 1, 2026, living in Baltimore and navigating homelessness while running a one-man website-and-automation studio. The hardware is a 24 GB RAM local rig. The business is Mike Builds — and it already exists. The four-door site (porch, plumber, realtor, automation) is built and live, the Charm City Sites factory with its five n8n workflows is assembled, AssetForge v1.0.1 shipped with 24 passing tests, and the automation products are fully specified down to their prices. Nothing about this sprint requires building anything new from scratch. What is missing is not capability. It is collection.

This playbook exists to close that gap with money that does not exist yet: the student stack. Verified enrollment converts roughly $1,500 to $2,000 of first-year software, cloud credits, domains, and connectivity into a zero-dollar cost of goods. Every tool in the chain — from the IDE to the AI pair-programmer to the static hosting to the phone in your pocket — can be had for free as a full-time student. The only genuine inputs left are hours and follow-through, and both are renewable.

> **$0**
>
> Total software + infrastructure cost of the entire 45-day machine, if every benefit in this playbook is claimed

The math is honest and small. The plumber door sells flat-fee websites at $500, $650, and $800 — built before payment, owned outright. The realtor door sells content packs at $297 or $497 per month. The automation door sells four add-ons from $300 to $400 once, plus a 24/7 receptionist at $297 per month. The $2,000 target therefore means three to five closed deals in 45 days — one close every nine to fifteen days. That is not a hail mary. That is a dribble.

Path	The math	Difficulty
Four flat sites	4 x $500 plumber-door builds	Easiest to sell, heaviest to deliver
Two bigger + two small	2 x $750 sites + 2 x $250 automation add-ons	Balanced week-to-week load
One of each door	$800 site + $650 site + $550 combined add-ons	Proves all three lanes at once
Recurring floor	2 sites ($650 avg) + 2 receptionists at $297/mo	Hardest sell, best November 27 setup

Four honest paths to $2,000 by November 15

One rule governs every page that follows, and it is already stamped on every asset the business owns: the phone number is the business. 410-575-4192 appears on every door, in every closing plate, in the sticky

bar, in the metadata. Nothing gets added between a prospect and that number — no forms, no funnels, no email gates. Every optimization in this playbook either increases the number of people who see the number or shortens the distance between seeing it and calling it.

> *The work is the proof. Built before you pay. A human answers.*

2. Phase 0 — Claim the Stack (Days 1-3)

Order matters, because almost everything hangs off one verification: the GitHub Student Developer Pack. It unlocks the free domain, the cloud credits, Copilot Pro, and a dozen partner tools in a single application. Apply at education.github.com/pack using the WGU student email issued at enrollment, or the document-based verification flow if the email is slow to arrive. Set the GitHub profile email to the student address before applying — mismatched emails are the most common rejection cause, and rejections cost a week.

1. **GitHub Student Developer Pack.** Copilot Pro free for verified students (including the model picker in Copilot Chat — Claude, GPT-class and Gemini-class models at no cost), $100 Azure for Students credit with no credit card, $200 DigitalOcean credit, Heroku monthly student credits, MongoDB Atlas ($50 credit plus the forever-free M0 cluster), Termius Pro, GitKraken Pro, Datadog Pro monitoring for two years, and Lucidchart Educational. Claim everything in one sitting; unclaimed credits still expire.
2. **The free domain.** Namecheap runs a one-free-year .me educational registration; Name.com offers one free domain from modern endings (.live, .dev, .app, .studio, .software) bundled with WHOIS privacy; get.tech has offered .tech through the pack page. Take whichever ending the pack currently offers — the name decision itself is settled in Phase 1.
3. **JetBrains student license.** PyCharm Pro, WebStorm, and IntelliJ IDEA Ultimate, free with student verification, renewed yearly. WebStorm alone replaces a paid editor subscription most agencies eat monthly.
4. **Figma Education.** The professional tier free for verified students — unlimited files, dev mode, the works. This is where client mockups happen before they touch code.
5. **Notion Education.** Free Plus-plan upgrade. One workspace: the lead pipeline, the sprint calendar, and the WGU course tracker in one place.
6. **WGU portal inventory.** Log in during week one and write down exactly what tuition already pays for. The reported lineup includes Pluralsight, Percipio, LinkedIn Learning, Udemy Business, and Microsoft 365 — but the portal itself is the source of truth. Thirty minutes, one list, done. Do not assume; do not guess.

7. **Google account hygiene.** One account becomes the business identity: Google Business Profile, NotebookLM, Colab, and the Analytics property for the porch page all hang off it.

> **7 accounts**
>
> Everything Phase 0 produces. Each one takes under 15 minutes; the whole stack is a single afternoon at the library.

The skip list matters as much as the claim list. AWS Educate is a sandbox with weak transfer paths — Azure and DigitalOcean cover cloud needs with real credits. Canva for Education is aimed at K-12 teachers; the free tier covers client thumbnails, so spending verification effort there is wasted motion. And the "Stripe student fee waiver on the first $1,000" that circulates in student-benefit lists does not correspond to any program Stripe actually documents — see the Ledger in Section 9, and plan around standard fees instead.

Set three calendar reminders the same day you claim things. JetBrains renews yearly with re-verification. Figma Education renews on a two-year cycle. The domain renews at month eleven — and that renewal price is where free domains quietly become expensive ones, which Phase 1 defuses. Credits need no reminders, only respect: DigitalOcean's expire in a year whether used or not, and Azure student credits run out on their own calendar.

3. Phase 1 — Infrastructure on $0 (Days 2-5)

The domain decision, settled in thirty minutes: mikebuilds.tech. The .com is taken and parked on a reseller's page — chasing it means a broker and a four-figure ask, which is a stall wearing a suit. The .tech resolves to nothing and is registrable, the entire site's metadata is already baked for mikebuilds.tech, and the name says exactly what the shop does. More importantly, the pattern that kills momentum here is already known: getting stuck on the name stalls the business. So the rule is a hard cap — thirty minutes from question to registration, then it is over. If the pack offers a free .tech, take it. If not, it is a $5-10 first-year retail purchase at Porkbun or Namecheap, which is lunch money.

The renewal trap, and how to defuse it

Free and cheap domains are loss leaders: a .tech that costs pocket change in year one renews at $30-60 per year at retail registrars. Two moves neutralize this. First, after the mandatory 60-day ICANN wait, transfer the domain to Cloudflare Registrar, which sells at wholesale cost with zero markup — the renewal drops to roughly a third of retail (check the live price when transferring; at-cost is the guarantee, not a specific number). Second, once the business has cash flow, if the .com ever becomes available at a normal list price, buy it and 301-redirect it to the .tech. Until then the domain is a container, not a

converter — the phone number and the work convert.

Publish-anywhere deployment — the baked site

The site now ships as a self-contained static package: every page carries its full stylesheet inlined in the HTML, all asset paths are page-relative, and a .nojekyll file guards the underscore-named asset folder from GitHub Pages' default processor. This is deliberate insurance against the two ways styles "fall off" after publishing — a host that drops the external CSS file, and Jekyll silently ignoring the _next directory. With the CSS living inside the HTML itself, there is no stylesheet request left to fail. The ritual is short: bake, preflight, publish. The preflight script serves the package locally and verifies all 37 checks — inlined styles, resolving assets, no absolute paths, phone number present — and anything short of all-pass means do not publish yet.

Target	How	Notes
Cloudflare Pages	Dashboard → Workers & Pages → Create → Pages → Upload assets; drop the site-static folder	Recommended: free tier, unlimited bandwidth, global CDN, automatic SSL
GitHub Pages	New repo → upload site-static contents → Settings → Pages → deploy from branch	Free; .nojekyll already inside the package
z.ai publish	Publish from the project	If a published copy ever looks unstyled, publish the site-static folder instead — it cannot lose its CSS

Three publish targets, one package

The last two pieces of infrastructure

Email on the domain costs nothing: Cloudflare Email Routing forwards mike@mikebuilds.tech to the existing Gmail inbox for free, which means client-facing messages stop coming from a bare Gmail address without paying for a mailbox. Then the free lead engine gets built: a Google Business Profile for Mike Adds, categorized under web design services in Baltimore, with the phone number as the primary contact, the porch page as the website, and photos of actual work. It is the single highest-leverage free marketing asset available to a local service business — it puts the shop into the map pack where "website builder Baltimore" searches actually happen. Print nothing yet; when something is printed, it carries a QR code to the porch page and the number, and nothing else.

48h

From domain decision to a live, styled, preflight-passed site on mikebuilds.tech with working email forwarding — using only the baked package

4. Phase 2 — Baltimore Lifeline & Connectivity

The physical layer matters as much as the digital one. A dead phone kills the entire model — every door ends in a call or text, so connectivity is not a comfort, it is the point of sale. Baltimore maintains a stack of programs for exactly this situation, and Maryland Physicians Care Medicaid is the key that opens most of them. Claiming them is a parallel track this week, not a someday list, because each one removes a monthly bill or a hardware dependency from the business's cost structure.

Program	What it provides	How to claim
Lifeline (via Medicaid)	Free smartphone plus monthly data from carriers such as AirTalk Wireless, TAG Mobile, or SafeLink — one per household	Apply on the carrier's site with Maryland Physicians Care / Medicaid documentation
PCs for People — 2901 E Biddle St	Free or low-cost refurbished computers, diagnostics and repairs, low-cost internet options	Walk in with proof of benefits (Medicaid/SNAP) and ID
Maryland Digital Connectivity Program	Free laptops distributed through Marylanders Online partners — roughly 34,000 devices, one per address	Contact Marylanders Online / UMD Extension partners for the current distribution schedule
Enoch Pratt Free Library	Free Wi-Fi, public computers, printing, and Wi-Fi hotspot lending at branches	Get a library card; ask the branch about hotspot holds
human-I-T	Low-cost devices and connectivity for benefit-verified households	Apply online with benefits verification
Comcast Internet Essentials	$9.95/month home internet for Medicaid-eligible households	When serviceably housed — requires an installable address

Baltimore connectivity and hardware programs

One discipline keeps this clean: the Lifeline phone is the data backup, never the business line. 410-575-4192 is printed on every asset the business owns, and porting or splitting it across a benefit device invites exactly the kind of disruption a 45-day sprint cannot absorb. The business number stays where it is, on whatever phone it currently lives, answered by a human. The Lifeline device carries data,

runs the hotspot, and backs up the first one.

Then the daily structure writes itself around the Pratt library as headquarters. Mornings at a branch are the outreach blocks — quiet, powered, connected, free. Afternoons are build blocks on the 24 GB rig wherever power permits. Evenings are follow-up texts from the phone, sent from wherever the day ends. The entire business fits in a backpack, and that is not a hardship posture — it is a cost structure competitors paying for an office cannot match.

> **$0/month**
>
> The connectivity stack once Lifeline, the library, and the benefit programs are claimed

5. Phase 3 — The $2,000 Machine (Days 5-45)

Everything the sales motion needs was already built and tested in previous sessions. The Charm City Sites bundle contains the site generator, the lead scraper, and five ready n8n workflows — the lead machine, the outreach engine, the deal closer, the form alerts. Its README includes a 45-minute ignition sequence that is, functionally, the launch checklist for this phase. AssetForge shipped clean. The demo site exists. The doors are live. Phase 3 is therefore not about building the machine; it is about switching it on and feeding it contacts every single day.

The daily 15-touch ritual

The scraper fills Leads.csv with Baltimore trades and realtors pulled from Google Maps. The ritual is fifteen personalized touches per day: five new prospects, ten follow-ups on the existing threads. Every message is short, plain, and ends with the number. The pitch does not sell a website — it sells the proof: "I build it first, you pay only if you like it. Flat price, you own it outright." Fifteen touches a day for 45 days is 675 contacts, and the arithmetic of this business lives in that volume, not in any single conversation.

The demo flow — proof before the ask

When a prospect bites, the move is the mockup, not the pitch deck. Build a mockup of their actual homepage — roughly ninety minutes with Copilot Pro and the site factory — then record a sixty-second phone video of it scrolling, and send that video. The video is the entire sales letter: it shows their name, their trade, their town, and a finished thing they can hold in their hand before anyone has asked them for money. This converts because the proof arrives before the ask, which is the whole philosophy of the shop compressed into one text message.

Closing and collecting — the honest money picture

There is no Stripe student fee waiver. Searches for it return nothing from Stripe and no program documentation anywhere — treat it as a myth and price fees in instead. The realistic menu: Stripe invoicing at 2.9% plus 30 cents for clients who insist on cards; Square at 2.6% plus 10 cents for in-person closes; Zelle for the free instant transfer most trades already live on; and cash or check for the rest. On a $500 site the entire Stripe fee is about $15 — the margin question is never the processor, it is whether the deal exists at all.

The recurring floor is what makes November 27 matter. A light care plan at $50-100 per month keeps a delivered site healthy and keeps the relationship warm. The flagship recurring product is the 24/7 receptionist at $297 per month — and two of those alone are $594 of monthly revenue that arrives whether or not a new deal closes. Every flat-fee delivery ends with a care-plan offer in the same text thread; it costs one sentence and it is the difference between a one-time sprint and a business.

Stage	Conservative	Strong
Touches (15/day x 45 days)	675	675+
Replies at 8-12%	54	81
Conversations to closes at 5-8%	3	6
Average deal	$450	$650
Revenue	$1,350 + retainer	$3,900

Pipeline math — why the bottom of every range still works

Read the bottom row of that table with the right eyes: even the conservative column clears $2,000 with a single receptionist retainer or care-plan pair stacked on top, and the strong column turns the target into a floor. The machine does not need luck. It needs fifteen touches a day, every day, with no gaps — which is why the calendar in Section 8 exists and why the guardrails in Section 10 are written like they are.

6. Phase 4 — Local Hardware + Free AI

The 24 GB rig is the unfair advantage, because it runs inference with zero meter. Install Ollama and pull a coder model — Qwen2.5-Coder 14B or a DeepSeek-Coder variant are the workhorses — for first drafts, boilerplate, and client-site scaffolding. Run Whisper locally for the realtor lane: a sixty-minute listing or podcast video transcribes in minutes on this hardware, and that transcript is the raw material the entire content-pack product is built from. ffmpeg, also local and free, handles the clip automation that turns one long video into thirty days of posts.

Copilot Pro — free through the student pack — carries the heavy lifts. Architecture decisions, gnarly debugging, and sales-copy variants are what the frontier models in Copilot Chat are for; the local models handle volume, and the cloud models handle judgment. Google Colab's free T4 absorbs batch jobs that do not fit locally, like long transcodes or bulk image processing for a content pack. The split is deliberate: nothing billable should ever queue behind a job that a free tier could have eaten.

The automation stack is n8n, self-hosted and free, running the same five workflows the Charm City Sites bundle ships with. This does double duty: the missed-call texter answering your own number is the most persuasive possible sales demo for the product that sells it. MongoDB Atlas's free M0 cluster holds client backends, Datadog's two free years of Pro watches the automations and pages when a workflow dies, and the Azure and DigitalOcean credits absorb any burst hosting a client project needs. Every paid-tier tool the business touches is either free through the pack or running on hardware already owned.

Then the discipline that keeps AI work billable: a thirty-minute rule. If a model session is not producing client-facing material or a sellable automation within thirty minutes, close the terminal. Local models are free, but the hours they can eat are the scarcest resource this sprint has, and tinkering is the highest-tax hobby in this profession. The $2,000 KPI outranks curiosity for exactly 45 days — after that, tinker on the winnings.

> **24 GB**
>
> Local RAM running the draft factory. Every token the rig generates is margin the competition pays a provider for.

7. Phase 5 — WGU Without the Time Sink

WGU is competency-based, which means acceleration is not merely allowed — it is the design. Courses pass when the assessments pass, not when seat-time accrues, so a student who already builds software daily is sitting on accumulated competence the degree has not yet invoiced. The term plan for these 45 days is deliberately minimal: pass the first two or three courses on schedule, bank the momentum, and refuse to gold-plate a GPA that no client will ever ask about. The degree is the long game; the business is the now game; both fit inside the same calendar only if neither is permitted to sprawl.

The legitimate double-dip is the quiet superpower of this particular program: the AI Engineering curriculum — Python, machine learning fundamentals, data handling — is the same material the client work already exercises daily. A study session on data pipelines is a study session that also levels the automation products. Choose the Udemy Business and Pluralsight courses (tuition-covered, confirmed in the portal during Phase 0) to fill the exact gaps clients are currently paying to have filled, and every learning hour becomes billable-adjacent by construction.

Tooling keeps the study load light. NotebookLM, free on the Google account, turns course PDFs into queryable study packs and audio overviews that play during walks between the library and wherever the afternoon lands. Forty-five-minute study sprints slot between the morning outreach block and the afternoon build block without cannibalizing either. The sprint ends November 15; the term does not — so the last week's calendar deliberately shifts study weight forward, letting the business wind down to care-and-collection while coursework winds up.

8. The Calendar — Week by Week

Week	Dates	Targets
0	Oct 1-5	Stack claimed (all 7 accounts). Domain registered. Site baked, preflighted, live on mikebuilds.tech. Email forwarding on. Google Business Profile submitted. Lifeline application filed. Library card + hotspot.
1	Oct 6-12	Charm City ignition (45 min). 75 cumulative touches. First three demo mockups built and video-sent. WGU course 1 started.
2	Oct 13-19	150 cumulative touches. First close targeted and invoiced. Two follow-up cadences tuned. Checkpoint: 5+ warm conversations, or swap vertical emphasis.
3	Oct 20-26	Delivery 1 shipped + care-plan offer sent in-thread. Pipeline holds 4+ warm leads. Course 1 assessment passed.
4	Oct 27-Nov 2	Closes 2-3 collected. 300+ cumulative touches. Standing 10-minute PO update kept (it protects the 45 days). Second receptionist pitch out.
5	Nov 3-9	Court-date week: business as usual, lighter touch volume (10/day). Collections push on every open invoice. Course 2 assessment scheduled.
6	Nov 10-15	Close the gap: final 75 touches, every warm thread called directly. Count the money. Decide the Black Friday play (care plans as November purchases; January-visibility site specials booked now).

October 1 to November 15, 2026

The checkpoints are kill/keep decisions, not feelings. If October 19 arrives with zero closes but five or more warm conversations, keep going and tighten the offer — warmth converts with repetition. If there are fewer than two warm conversations, the list is the problem, not the pitch: swap the emphasis between trades and realtors and re-run the ritual unchanged. If one door outsells the others two to one, double down on that door for the remaining weeks; a sprint is the one time diversification is a liability rather than a virtue.

The week of November 3 carries a standing obligation alongside the sprint — the court date and the probation check-in already live on the calendar. The ten-minute update habit (business developments only, zero-risk framing, no repetition) is not a detour from the $2,000; it is what keeps the operating environment stable enough to finish the sprint in. Send it on schedule, keep it short, and let the work speak the way it does everywhere else: in plain sentences with receipts attached.

Then the horizon: Black Friday, November 27. The 45-day window ends on the 15th, but every recurring contract signed during the sprint is already paying by then, and the care-plan pitch lands best when framed as a November purchase — "your site, healthy through the holidays, ready to be found in January." The sprint's real deliverable is not the $2,000. It is a business with a repeatable machine behind it, entering its first holiday season with recurring revenue on the books.

9. The Verified Benefits Ledger

Honesty is the whole point of this table, so every entry carries a status. VERIFIED means checked against live sources this week. ESTABLISHED means long-standing, well-documented programs that have not moved in years. PORTAL means provisioned through WGU tuition — confirm the exact lineup in the student portal during week one rather than trusting any list, including this one. MYTH means no evidence exists; plan around it. Anything that costs money after year one carries its trap in the last column, because the free-student stack is full of doors that are free to open and expensive to stay inside.

Benefit	St.	What it gives	Watch out
GitHub Student Pack	V	The master key: unlocks the partner list below via student verification	One per person; apply with the WGU email before anything else
Copilot Pro (students)	E	Free Pro incl. model picker in Copilot Chat (Claude / GPT / Gemini class)	Tied to verified status — re-verify if flagged
Azure for Students	E	$100 credit, no credit card required	Expires on its own 12-month calendar
DigitalOcean (via pack)	V	$200 credit, one year	Use it or lose it within the year
Heroku (via pack)	E	Monthly student credits for a year	Requires the GitHub pack first
MongoDB Atlas	E	$50 credit + free-forever M0 cluster	M0 has shared capacity limits (fine for client MVPs)
JetBrains student pack	E	PyCharm Pro, WebStorm, IntelliJ Ultimate free	Yearly re-verification
Figma Education	E	Professional tier, free for students	Two-year verification cycle
Notion Education	E	Free Plus-plan workspace	Personal use sizing
Termius / GitKraken / Datadog / Lucidchart	E	Pro tiers via the pack (Datadog: two years)	Datadog capacity is per the pack terms
Free domain (Namecheap .me / Name.com / get.tech)	V	One domain, first year free, WHOIS privacy included	Retail renewal after year 1 — transfer to Cloudflare at cost (Section 3)
WGU portal lineup (Pluralsight, Percipio, LinkedIn Learning, Udemy, M365)	P	Tuition-covered learning platforms + Office	Portal is the source of truth — inventory week one
Google Colab free	E	T4 GPU sessions for batch jobs	Session limits; not a production home
Lifeline via Medicaid	V	Free smartphone + data (AirTalk / TAG / SafeLink), one per household	It is the backup line — never the business number

Benefit	St.	What it gives	Watch out
PCs for People (2901 E Biddle St)	E	Free / low-cost refurbished hardware + repairs	Walk in with benefit proof and ID
MD Digital Connectivity	V	Free laptops (~34,000 distributed), one per address	Distribution windows via Marylanders Online partners
Enoch Pratt library services	E	Wi-Fi, computers, printing, hotspot lending	Branch-level availability — ask, don't assume
human-I-T	E	Low-cost devices + connectivity	Catalog changes; check current Baltimore stock
Cloudflare Pages + Email Routing	E	Free static hosting, unlimited bandwidth, free SSL; free domain email forwarding	None — this is the backbone
Google Business Profile	E	Free local-map presence; the actual lead engine	Requires verification postcard or video in some cases
SCORE Baltimore / City SBRC	E	Free business mentoring and workshops	Time cost only
Prime Student / Spotify / Peacock / Apple Music / Kanopy	E	6-month Prime trial; $5.99 Spotify+Hulu; $2.99 Peacock; student Apple Music w/ TV+; free Kanopy via library	Quality-of-life wins, not business inputs — budget the dollars that renew
Stripe student fee waiver	M	Nothing. No such documented program exists	Plan on 2.9% + 30c or Zelle/Square (Section 5)

The full stack, statuses and traps (V = verified, E = established, P = portal, M = myth)

The Stripe entry deserves its own paragraph because it is the one line in circulating benefit lists that can silently poison a revenue plan. A fee waiver on the first $1,000 processed sounds plausible, tailors to exactly this situation, and appears nowhere in Stripe's own documentation or pricing pages — the signature of a list-filler myth rather than a program. The working stance: collect through Stripe at standard rates, lean on Zelle for trades clients who already use it, take Square in person, and treat every processing fee as a cost of a deal that exists rather than a problem to solve. The margin math in Section 5 already absorbs it.

10. Guardrails — Anti-Stall Doctrine

The single biggest risk to this plan is not competition, pricing, or even homelessness — it is the stall pattern, already self-identified: getting stuck on a choice that feels important and letting it eat the days. So the doctrine is written as rules with numbers, because a rule with a number can actually be followed. The domain decision took its thirty minutes and produced an answer; every future naming, branding, or tooling decision gets the same cap. Thirty minutes, decide, move, and let the work arbitrate later.

1. **Thirty-minute cap on identity decisions.** Names, colors, logos, taglines — thirty minutes then ship the best answer in the room. Revisit only with revenue in hand.
2. **Done beats perfect.** A shipped $500 site funds the next decision. An unfinished perfect one funds nothing.
3. **Ship weekly.** Every Friday, something client-facing goes live: a demo mockup, a delivered site, a content pack. The week is not over until it has.
4. **Stack freeze after Day 5.** No new tools enter the machine after October 5. New touches, new mockups, new closes — never new software.
5. **The one-number rule.** Every asset ends in 410-575-4192. If a decision adds anything between a prospect and that number, it is wrong by definition.
6. **Copy discipline.** Short plain sentences, varied rhythm, and none of the dead words: no "seamless," no "tailored," no "solutions." Write like a person with dirty hands who happens to build websites.
7. **Never spend on:** logo redesigns, premium themes, ads, a second monitor, or incorporation paperwork — before revenue says otherwise.

When the stall feeling arrives anyway — and it will, usually disguised as research — three sentences are the whole reset. The work is the proof. Built before you pay. A human answers. Each one is already load-bearing somewhere in the business: the first is the portfolio policy, the second is the sales offer, the third is the customer promise. Say them in order, close the tab that opened, and go touch fifteen more prospects.

The next 24 hours

1. Claim the GitHub Student Developer Pack with the WGU email. Everything else chains off it.
2. Register mikebuilds.tech (free via pack, or $5-10 retail) — thirty-minute cap starts now.
3. Bake the site (BAKE=1), run the preflight, publish to Cloudflare Pages, connect the domain, turn on email forwarding.
4. File the Lifeline application with Maryland Physicians Care documentation.

5. Get the Pratt library card and ask about hotspot holds.
6. Put tomorrow's fifteen touches in Leads.csv before sleeping. The machine starts on time or it does not start.
